Higher degree of Safety:
Easy Edge Composite Sealer addresses the special demands placed on P&O composite device manufacturing by greatly reducing or eliminating the need for sophisticated ventilation systems as required by other instant adhesives.

No Hazy Residue:
Easy Edge Composite Sealer’s no bloom characteristics make it an ideal choice for finishing expensive composite medical device edges. This non-blooming formula also means no nasty chemical odors typically associated with the off-the-shelf brands.

Incredibly Fast:
When used with Easy Edge Activator, cure times are 10 to 15 seconds.

Features:
- Virtually no smell
- No “blooming” residue
- 10 to 15 second cure time
- Penetrating viscosity
- Professional edge quality

Perfect Viscosity:
Easy Edge Composite Sealer has a perfect flowing viscosity of 1000cps. This viscosity is ideal for Synthex and other laminated composite structures. It allows the product to flow into and penetrate exposed fibers and spaces on an unfinished composite edge, thereby allowing the edge to be sanded glass smooth in appearance and feel. This balanced viscosity—combined with the other features—is what separates Easy Edge from store and hobby shop instant adhesives.
